Conflict Escalation Dashboard Report

Automated portfolio risk monitor | Generated 2026-03-11 23:19 UTC

This report summarizes the model's current read on conflict escalation risk, probabilistic conflict duration, and the associated portfolio regime. The framework combines market-derived signals, optional event data, and available news proxies.

Metric	Latest
Escalation Score	0.060
P(De-escalation)	0.6%
P(Stabilization)	94.6%
P(Escalation)	4.9%
P(Short War 2-4w)	29.8%
P(Extended 1-3m)	36.6%
P(Long Proxy 6-24m)	33.6%
Portfolio Regime	Stabilization
Recommended Action	Stay balanced, avoid headline chasing, keep hedges lighter but intact, favor quality and liquidity while waiting for cleaner confirmation.

Interpretation

The model currently indicates a **Stabilization** regime. Near-term conflict duration probabilities are tilted toward **36.6%** for an extended 1-3 month conflict, versus **29.8%** for a short war and **33.6%** for a long proxy conflict.

Method / caveat notes

This version is partially dependent on available market data and may be constrained by news API rate limits. If GDELT or ACLED do not fully populate, the model leans more heavily on market-derived signals.

Conflict Escalation Trend
